

COMPONENTS FOR INDUSTRIAL VEHICLES

has been manufacturing fittings for trailers, semitrailers and trucks.

Analyzing the greater and greater use of automation on the road transport sector, Fermi has created the stabilizers series LEG.

Leg 100 is an automatic stabilizer which, thanks to a pneumatic cylinder, can reach in a few seconds its maximum extension stabilizing the semitrailer.

At first LEG has been conceived as a component on the automatic coupling truck-semitrailer but considering its simplicity is already replacing the traditional landing gears.

The features which makes LEG unique of its kind are:

- Strong : square steel pipe mm120x4;
- Lightweight : only 89,00 kg per pair;
- Reduced encumbrance : mm 700 when LEG is closed;
- Easy to use : only 2 buttons;
- Fast opening and closing operation : few seconds;
- Easy installation : only 2 plastic pipes Ø 6 connected to the air plant of the semitrailer;
- Possibility to install the opening/closing control near the driver's cab;
- No maintenance : there are no mechanical parts like gears or spindle/female thread;
- Safe mechanical blocks : thanks to a spring system, mechanical blocks operate also when air is missing;
- Versatile : the absence of the connection shaft allows to fix LEG to the semitrailer choosing the most suitable position;
- Cheap.
